Admixture in concrete

Introduction:

Admixture in concrete is a water reducing type PCE in our factory, It is produced by our technician, low dosage, high water reducing rate.

Quality Specification

Item	Unit	Standard
Appearance	/	White or light yellow to brown viscous liquid
Density	g/cm ³	1.10±0.02
pH value	/	5-7
Solid Content	%	50±1.0
Cl ⁻	%	≤0.02
Total Alkali	%	≤0.3

Admixture in concrete Play An Important Role In Engineering

Admixture in concrete can not only meet the production requirements of the pipe, but also better than aliphatic water-reducing agent in the production process, strength and durability of the pipe. The application of concrete admixture PCE Powder in the precast pipe industry has been developed rapidly. The following small series for you to introduce the concrete admixture in the engineering plays an important role. Admixture in concrete is an important material to ensure the quality of the whole project. Adding concrete admixture in engineering can greatly improve the workability of concrete, improve the density of concrete, and then improve the strength and durability of concrete. Adding admixture can improve the fluidity of mixture. The anchoring effect of space stabilization to reduce slump loss; The effects of electrostatic potential resistance and spatial potential resistance. Under different season and temperature conditions, concrete admixture has good adaptability and good slump protection.

In addition, in the building when the concrete pump, often mixing concrete temperature is high, so the cement hydration rate and moisture evaporates more quickly, resulting in the slump loss of concrete is bigger, the high efficiency water reducing agent can be used with sugar calcium composite retarder used technology, adjust the setting and hardening speed of concrete, controlling concrete slump loss effectively.
